Q-Q Plots (Quantile-Quantile)

- Graphical tool to help assess if a set of data **comes from some theoretical distribution**
- Plot Quantiles against each other
- Relies on Rank Statistics (or ordering the values from lowest to highest first)

Constructing a Q-Q Plot (X-axis values)

| cith | rank | percentile | rank-based z-score | cith |
|------|------|------------|--------------------|------|
| 11 | 1 | 0.0037313 | -2.675459606 | 11 |
| 13 | 2 | 0.0111194 | -2.283718847 | 13 |
| 14 | 3 | 0.0186567 | -2.082318 | 14 |
| 14 | 4 | 0.0261194 | -1.941160555 | 14 |
| 14 | 5 | 0.0335821 | -1.83057382 | 14 |
| 15 | 6 | 0.0410448 | -1.738688601 | 15 |
| 15 | 7 | 0.0485075 | -1.659500771 | 15 |
| 15 | 8 | 0.0559701 | -1.589532164 | 15 |
| 15 | 9 | 0.0634328 | -1.526579244 | 15 |
| 17 | 10 | 0.0708955 | -1.469153923 | 17 |
| 17 | 11 | 0.0783582 | -1.416201838 | 17 |
| 17 | 12 | 0.0858209 | -1.366947407 | 17 |
| 17 | 13 | 0.0932836 | -1.320802685 | 17 |
| 17 | 14 | 0.1007463 | -1.277310814 | 17 |
| 17 | 15 | 0.108209 | -1.236109375 | 17 |
| 18 | 16 | 0.1156716 | -1.196905773 | 18 |
| 18 | 17 | 0.1231343 | -1.159460185 | 18 |
| 18 | 18 | 0.130597 | -1.123573438 | 18 |
| 18 | 19 | 0.1380597 | -1.089078199 | 18 |
| 18 | 20 | 0.1455224 | -1.055832437 | 18 |
| 19 | 21 | 0.1529851 | -1.02371449 | 19 |
| 19 | 22 | 0.1604478 | -0.992619286 | 19 |

Come from a normal distribution (theoretical distribution)

Calculated based on the percentiles (click on the values in Excel to see formula)

Constructing a Q-Q Plot (Y-axis values)

| cith | rank | percentile | rank-based z-score | cith |
|------|------|------------|--------------------|------|
| 11 | 1 | 0.0037313 | -2.675459606 | 11 |
| 13 | 2 | 0.011194 | -2.283718847 | 13 |
| 14 | 3 | 0.0186567 | -2.082318 | 14 |
| 14 | 4 | 0.0261194 | -1.941160555 | 14 |
| 14 | 5 | 0.0335821 | -1.83057382 | 14 |
| 15 | 6 | 0.0410448 | -1.738688601 | 15 |
| 15 | 7 | 0.0485075 | -1.659500771 | 15 |
| 15 | 8 | 0.0559701 | -1.589532164 | 15 |
| 15 | 9 | 0.0634328 | -1.526579244 | 15 |
| 17 | 10 | 0.0708955 | -1.469153923 | 17 |

| 17 | 14 | 0.1007463 | -1.277310814 | 17 |
| 17 | 15 | 0.108209 | -1.236109375 | 17 |
| 18 | 16 | 0.1156716 | -1.196905773 | 18 |
| 18 | 17 | 0.1231343 | -1.159460185 | 18 |
| 18 | 18 | 0.130597 | -1.123573438 | 18 |
| 18 | 19 | 0.1380597 | -1.089078199 | 18 |
| 18 | 20 | 0.1455224 | -1.055832437 | 18 |
| 19 | 21 | 0.1529851 | -1.02371449 | 19 |
| 19 | 22 | 0.1604478 | -0.992619286 | 19 |

YOUR DATA

Is it any GOOD?

$R^2 \approx 1$ Means there is a
STRONG Association

We will circle back to r later...

| cith | rank | percentile | rank-based z-score | cith |
|------|------|------------|--------------------|------|
| 11 | 1 | 0.0037313 | -2.675459606 | 11 |

| 18 | 20 | 0.1455224 | -1.055832437 | 18 |
| 19 | 21 | 0.1529851 | -1.02371449 | 19 |
| 19 | 22 | 0.1604478 | -0.992619286 | 19 |

Study Types

- **Experimental** – **IS AN INTERVENTION** with the subjects
 - Example: Randomized Control Trials (RCT)
- **Longitudinal** – measures an outcome at **multiple points in time** to measure **changes over time**
- **Cross-Sectional** – measures an outcome at **one point in time**

Cross-sectional study

Data collected at one point in time

Longitudinal study

Data collected repeatedly over time

Meta-analysis

- “Meta-analysis is a research process used to **systematically synthesize or merge the findings of single, independent studies**, using statistical methods to **calculate an overall or 'absolute' effect**. Meta-analysis does not simply pool data from smaller studies to achieve a larger sample size.”

Shorten A, Shorten B What is meta-analysis? *Evidence-Based Nursing* 2013; **16**:3-4

Effect Size

- “an effect size is defined as **a metric quantifying the relationship between two entities**. It captures the **direction and magnitude** of this relationship. **If relationships are expressed as the same effect size, it is possible to compare them.**”
- Examples:
 - Correlation (Pearson’s r)
 - Mean Difference
 - Risk Ratio
 - Odds Ratio

Harrer, M., Cuijpers, P., Furukawa, T.A., & Ebert, D.D. (2021). *Doing Meta-Analysis with R: A Hands-On Guide*. Boca Raton, FL and London: Chapman & Hall/CRC Press. ISBN 978-0-367-61007-4.

Pearson's Correlation Coefficient (r)

- Measures the correlation between two variables:

$$r = \text{Corr}(x, y) = \frac{\text{Cov}(x, y)}{\sigma_x \sigma_y} = \frac{\sum (x_i - \bar{x})(y_i - \bar{y})}{\sqrt{\sum (x_i - \bar{x})^2 \sum (y_i - \bar{y})^2}}$$

Sometimes correlation can be abbreviated as $\rho(x, y)$ as well

Interpretation:

- $r = 1$: perfect **positive correlation**
- $r = 0$: no correlation
- $r = -1$: perfect **negative correlation**

* There is also Spearman's Rank Coefficient Correlation

Cohen's d

“Cohen's d is used to describe the **standardized mean difference of an effect**. This **value can be used to compare effects across studies**, even when the dependent variables are measured in different ways”

$$d_s = \frac{\overline{X}_1 - \overline{X}_2}{SD_{pooled}}$$

$$SD_{pooled} = \sqrt{\frac{(n_1 - 1)SD_1^2 + (n_2 - 1)SD_2^2}{n_1 + n_2 - 2}}$$

n_i = sample size of group i where $i = \{1, 2\}$

\overline{X}_i = mean of group i

Interpretation of Cohen's d :

$d = 0.2 \rightarrow$ Small Effect Size

$d = 0.5 \rightarrow$ Medium Effect Size

$d = 0.8 \rightarrow$ Large Effect Size
