

Week 2 Review

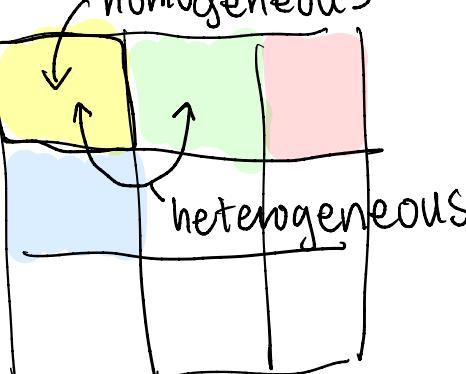

Cindy J. Pang

BIOSTAT 100A Summer Session C 2024

August 16, 2024

Probability (Random) Sampling

Type of Sampling	When/Why do this type of Sampling ↓ randomization	Selection Mechanism, or How to conduct this type of Sampling
<p>① Simple Random Sampling (SRS)</p> <p>every sample has an equal chance of being selected</p> <p>(1) w/o replacement - we don't put the draw back</p> <p>(2) w/ replacement - put the element back.</p>	<p>↓ convenience</p> <p><u>Assumption</u> - assume respondents in the same are <u>homogeneous</u>. This is <u>problematic</u> b/c most pop's are <u>not</u> homogeneous</p>	<p>(1) Population Listing / Pop'n Frame</p> <p>(2) Assign unique ID to each person in the frame</p> <p>(3) Draw randomly.</p>
<p>② Stratified random Sampling</p> 	<p><u>When</u>: there are homogeneous subpopulations (strata) / covariates within the pop'n you are interested in</p> <p>⇒ homogeneous within; heterogeneous across.</p> <p>$n_1 = \left(\frac{N_1}{N}\right)n = \left(\frac{30}{100}\right)50 = 15$ N = pop'n size</p> <p>$n_2 = \left(\frac{N_2}{N}\right)n = \left(\frac{60}{100}\right)50 = 30$ n = sample size</p>	<p>divide the pop'n into strata and take a SRS of each strata.</p> <p><u>Ex: Proportional Allocation</u> - how to select the # of people to include in a strata</p> <p>Suppose you have pop'n w/ 3 strata = {G_1, G_2, G_3} where $N = 100$ and $N_1 + N_2 + N_3 = N$, but we can only sample 50 people</p>

$$n_s = \left(\frac{N_i}{N} \right) n = \left(\frac{10}{100} \right) 50 = 5$$

$N=100$

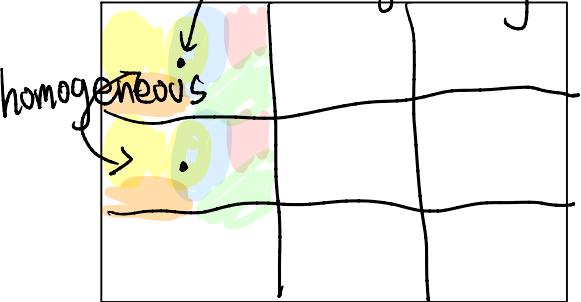

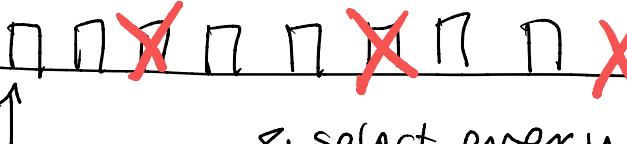

G ₁	G ₂	G ₃
$N_1=30$	$N_2=60$	$N_3=10$

$n_1=15 \quad n_2=30 \quad n_3=5$

$$n_i = \left(\frac{N_i}{N} \right) \cdot n \quad n=50$$

$i=1, \dots, \# \text{ of strata.}$

Probability (Random) Sampling

Type of Sampling	When/Why do this type of Sampling	Selection Mechanism, or How to conduct this type of Sampling
<p>③ Cluster Random Sampling <i>"the opposite" of stratified heterogeneity</i></p> 	<p><u>When</u>: 1) Convenient, ↓ costs 2) Data has natural groups or "clusters"</p> <p><u>Ex</u>: Test Performance across CA</p>  <p><u>1-Stage</u>: Take SRS of schools and sample all students in the school</p> <p><u>2-Stage</u>: After selecting schools, take SRS of teachers within selected schools and sample all their students</p>	<p><u>1-Stage</u>: Use SRS to select clusters and then sample all elements within the cluster</p> <p><u>2-Stage</u>: 1-Stage & SRS to select subgroups within the cluster; take elements in subgroup.</p>
<p>④ Systematic Random Sampling (Line Sampling)</p>	<ul style="list-style-type: none"> Population is dynamic Pop'n frame is in line format <u>ex</u>: list of addresses, phone #'s, etc. 	 <p>↑ randomly Select starting point</p> <p>& select every k^{th} element</p>

Data Display

- We can estimate the **Frequency Distribution** with:
 - (1) Tables and Graphs
 - Frequency Table
 - Histogram ("Bar Graph")
 - Information from a histogram
 - Cumulative Frequency Polygon
 - percentiles
 - Boxplot
 - rank statistics
 - parts of a boxplot
 - skewness, right vs left skew
 - (2) "Theoretical" Description
 - Normal (Gaussian) Distribution
 - Log-Normal Distribution
 - Why is this distribution useful?
 - Exponential Distribution
 - When is this distribution useful?
 - (3) Numerical (next lecture)
- Sensitivity vs Specificity
 - Trade-off** between Sensitivity and Specificity → What happens when you move the line?
- Outliers
 - how to identify outliers
 - what do you do about outliers? \downarrow

$$\text{Sensitivity} = \frac{\text{TP}}{\text{FN} + \text{TP}} \times 100 \rightarrow \% \text{ of people who correctly diagnosed if they have the disease}$$

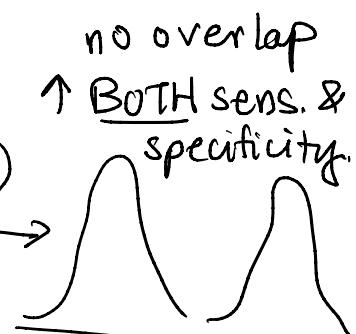

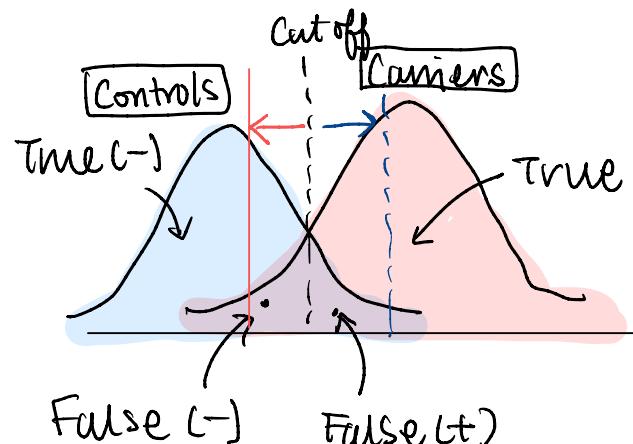

$$= \frac{P(\text{Have Disorder} \cap \text{Test}+)}{P(\text{Have Dis.})}$$

$$\text{Specificity} = \frac{\text{TN}}{\text{FP} + \text{TN}} \rightarrow \% \text{ of people correctly diagnosed if they don't have the disease}$$

$$= P(+ | \bar{D})$$

$$= P(- | \bar{D})$$

	Test (+)	Test (-)
Disorder (D)	True (+) (TP)	False (+) (FP)
No Dis.	False (-) (FN)	True (-) (TN)

Inverse Relationship

$\leftarrow \text{FP} \uparrow, \text{TN} \downarrow$
 $\text{Specificity} \downarrow, \text{Sensitivity} \uparrow$
 $\rightarrow \text{FN} \uparrow, \text{TP} \downarrow, \downarrow \text{FP}$
 $\text{Specificity} \uparrow, \text{Sensitivity} \downarrow$

Descriptive Statistics

Tables and Graphs

	What it looks like		What does it tell us / Utility?																				
Frequency Tables	<p>Counts Percentage</p> <table border="1"> <thead> <tr> <th>Interval</th> <th>Abs. Freq.</th> <th>Rel. Freq (%)</th> <th>Abs. Freq.</th> <th>Rel. Freq.</th> </tr> </thead> <tbody> <tr> <td>1-10</td> <td>5</td> <td>1-2%</td> <td>5</td> <td>1-2%</td> </tr> <tr> <td>11-20</td> <td>6</td> <td>6-7%</td> <td>11</td> <td>7-9%</td> </tr> <tr> <td>:</td> <td></td> <td></td> <td></td> <td></td> </tr> </tbody> </table>	Interval	Abs. Freq.	Rel. Freq (%)	Abs. Freq.	Rel. Freq.	1-10	5	1-2%	5	1-2%	11-20	6	6-7%	11	7-9%	:					<p>Cumulative</p> <p>Last Row = $\frac{\# \text{ obs}}{\text{total obs}} \times 100\%$</p>	Gives you the numbers
Interval	Abs. Freq.	Rel. Freq (%)	Abs. Freq.	Rel. Freq.																			
1-10	5	1-2%	5	1-2%																			
11-20	6	6-7%	11	7-9%																			
:																							
Histogram	<p>Freq.</p> <p>measurement</p> <p>outliers</p>		<ul style="list-style-type: none"> Shape of our frequency distr. <u>Outliers</u> → observations that appear "extreme" 																				
Cumulative Frequency Polygon	<p>100% 75% 50% 25% 25th percentile (Q1) Median 75th percentile (Q3)</p>		Estimating <u>Percentiles</u>																				
Boxplot	<p>25th p. (Q1) 75th p. (Q3) med. Q3 + 1.5 IQR outlier outlier territory $Q_1 - 1.5 IQR$ $Q_3 + 1.5 IQR$</p> <p>if no outliers, then:</p> <p>min max</p>		<ul style="list-style-type: none"> shape identify outliers (outside whiskers) 																				
Theoretical Descriptions																							
Normal Distribution	<p>$N(\mu, \sigma^2)$</p> <p>mean variance</p>		<ul style="list-style-type: none"> symmetric data mean = median 																				
Log-Normal Distribution	<p>LN</p> <p>Transf</p>		skewed data (right skewed)																				
Exponential Distribution			survival data																				

Numerical Descriptions of Data

- Measures of Location
 - (1) Arithmetic Mean (average)
 - (2) Median – how to find the median when it is even vs odd
 - (3) Geometric Mean
 - (4) Mode
 - (5) Midrange

Measure of Location

	Formula/ How to calculate it	When to use it	Statistic → Sample	Parameter → Population
Arithmetic Mean	$\bar{x} = \frac{1}{n} \sum_{i=1}^n x_i = \frac{x_1 + \dots + x_n}{n}$	symmetric distr.	\bar{x} = sample mean	μ = pop'n mean
Median	order all values → $y_2 < 50\%$ percentile $y_2 > 50\%$ percentile	skewed.		
Geometric Mean	1.) $\log(x_i)$, $i=1, \dots, n$ 2.) mean of the logs $\bar{x}_{\log} = \frac{1}{n} \sum_{i=1}^n \log(x_i)$	3.) $(e^{\bar{x}_{\log}})$ exponential distr.		
Mode	most freq. value	skewed data, bimodal $\boxed{ } \leftarrow$ no mode		
Midrange	$\frac{\max + \min}{2}$	Quick & Dirty Statistic
